

Figure S1. Validation of SNX10 knockdown. C57BL/6J mice were injected intratracheally with the adenovirus containing SNX10 shRNA plasmids. After 72 h, the model of abdominal sepsis was induced by cecal ligation and puncture (CLP). **A–E**, SNX10 protein levels in the mouse lung tissues. **F**, A549 cells were transfected with siSNX10 fragments and were subsequently collected 24 h later. SNX10 protein levels in A549 cells.
