

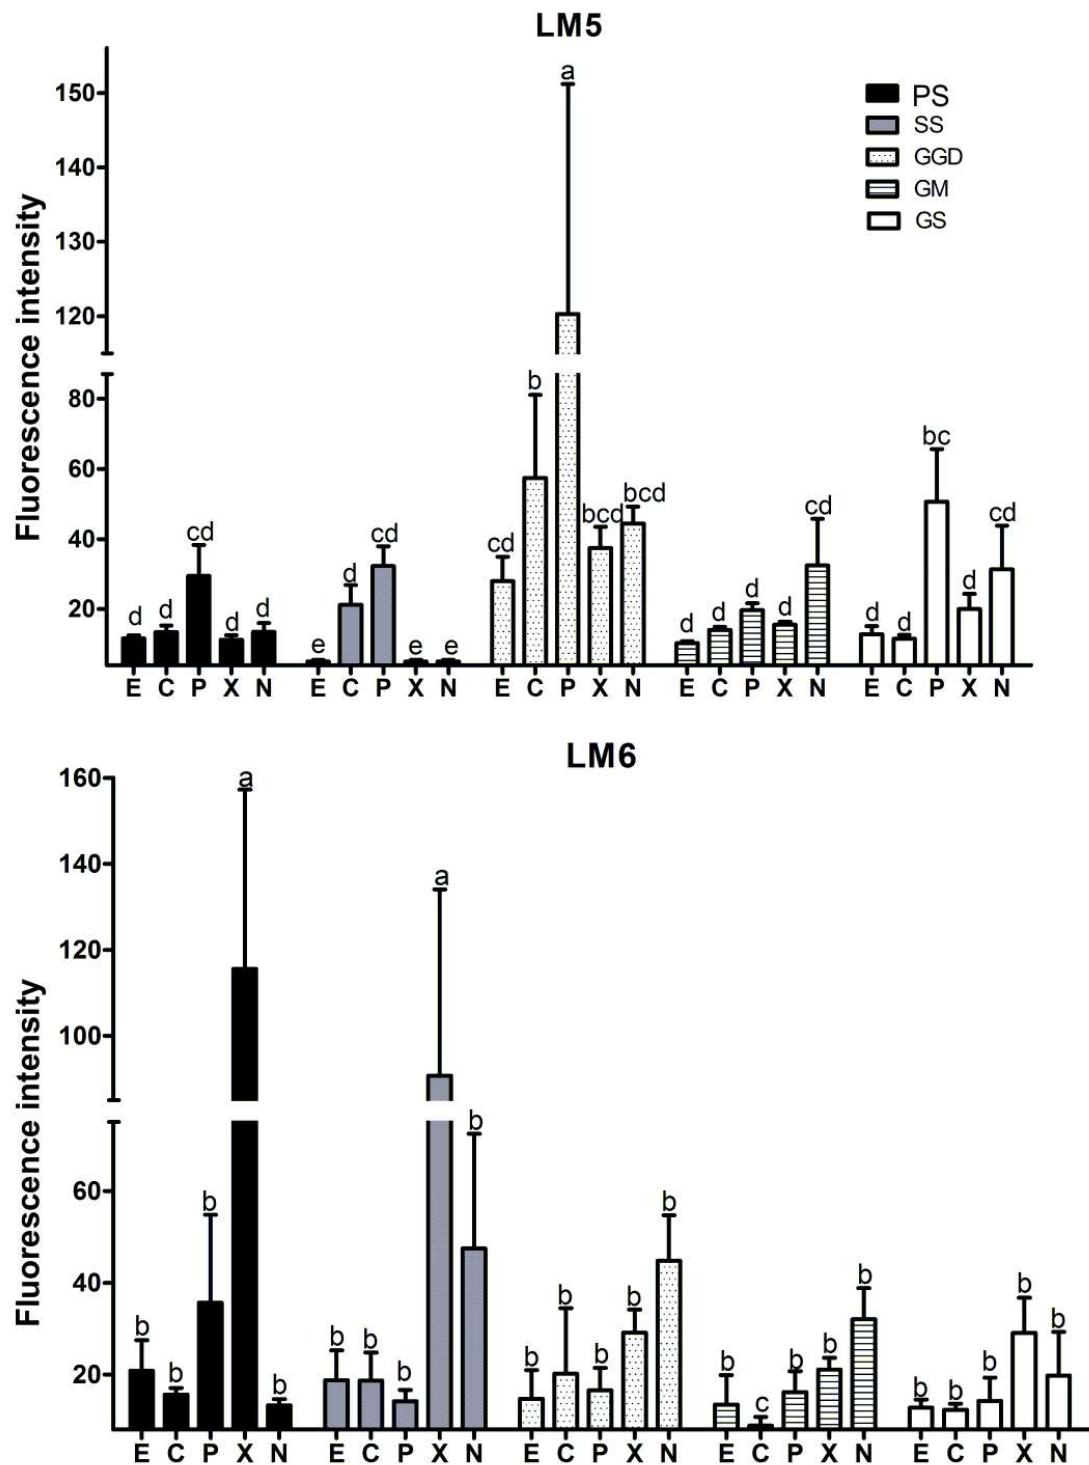

Figure S3. Mean distribution of galactans (LM5) and arabinans (LM6) per tissue and per organ in stems in primary growth (SP), secondary growth (SS), galls in growth and development phase (GGD), galls in maturation phase (GM) and galls in senescence phase (GS) in *Marctetia taxifolia* (Melastomataceae). Tissues: **E** = epidermis. **C** = cortical parenchyma. **P** = phloem. **X** = Xylem. **N** = pith (stems)/nutritive tissue (galls). Same letters on bars indicate statistically equal values for the same antibody, and different letters indicate different values. (n = 3, p < 0.05).
