

APPENDIX B

Risk factors and CAD progression.

Risk factors	OR	95%CI	P-value
Sex (male/female)	2.412	1.87- 2.86	<0.0001
Age (Years)	1.056	1.01 - 1.09	<0.0001
Diabetes	1.321	0.22 - 2.36	0.60
Antidiabetes medication	1.851	0.41 - 2.92	0.259
Hypertension	2.465	0.68 - 4.15	0.2840
Anti-Hypertensives	0.427	-1.79 – 2.08	0.312
Dyslipidemia	1.379	-0.29 - 2.64	0.618
Statin	1.428	0.47 – 2.60	0.551
Age ≥ 65 years-old	0.865	0.24 – 1.69	0.702

Legend: A multivariate logistic regression was performed with variables that have been qualified as risk factors since the Framingham study, and those with $p < 0,20$ in univariate analysis (not shown). Thus, sex, age in years and dichotomized at 65 years, hypertension, diabetes mellitus, dyslipidemia and medications (antihypertensives, antidiabetics and statins) were included in the model.
