

**Supplementary Material to “Evolutionary patterns in squamate
mitogenomes: are selective regimes associated with fossoriality and
limblessness?”**

Figure S4 – Results of RELAX analyses. The x-axis shows the selection intensity parameter (k), where values of k > 1 indicate intensified selection and k < 1 indicate relaxed selection; each point represents a mitochondrial protein-coding gene analyzed across squamate lineages, separated according to limblessness (left) and fossoriality (right).
