

**Supplementary Material to “Evolutionary patterns in squamate
mitogenomes: are selective regimes associated with fossoriality and
limblessness?”**

Figure S3 – Site-specific selection patterns across mitochondrial proteins in squamate species. For each gene (ATP6, ATP8, COX1–3, CYTB, ND1–6, and ND4L), the x-axis represents amino acid position and the y-axis shows the Empirical Bayes posterior probability of trait-associated shifts in evolutionary rate. Each point corresponds to an individual amino acid.
